# Slave Control API

API that connects the master and slave device by using the RS-485 network. The v2 devices will now work as a dummy reader when set as a slave device. It will not store any kind of information for user and all will be stored inside the master device. The slave device will send the information scanned, and the matching and access rule check will be done from the master device. The slave device will only receive the result.

- BS2\_GetSlaveDevice: Searches a slave device from the RS-485 network.
- BS2\_SetSlaveDevice: Add/Modify/Delete a slave device from the master device.
- BS2\_GetSlaveExDevice: In case of CoreStation, searches a slave device from the RS-485 network.
- BS2\_SetSlaveExDevice: In case of CoreStation, Add/Modify/Delete a slave device from the master device.
- BS2\_SearchDevicesCoreStation: Searches CoreStation devices from the current network.
- BS2\_SearchDevicesCoreStationEx: [+ 2.6.3] Searches CoreStation devices from the current network with host IP.
- BS2\_GetDevicesCoreStation: Gets searched CoreStation devices.

#### CAUTION

When the SDK is initialized, there are no information about the slave devices. Therefore, a slave device must be searched or added before controlling.

# Structure

### BS2Rs485SlaveDevice

```
typedef struct {
    uint32_t deviceID;
    uint16_t deviceType;
    uint8_t enable0SDP;
    uint8_t connected;
} BS2Rs485SlaveDevice;
```

1. *deviceID* Device ID.

2. *deviceType* Device type.

3. *enableOSDP* Decides whether to use a slave device.

### 4. connected

Displays whether a slave device is connected to the master device.

### BS2Rs485SlaveDeviceEX

```
typedef struct {
    uint32_t deviceID;
    uint16_t deviceType;
    uint8_t enable0SDP;
    uint8_t connected;
    uint8_t channelInfo;
    uint8_t reserved[3];
} BS2Rs485SlaveDeviceEX;
```

1. *deviceID* Device ID.

2. *deviceType* Device type.

3. *enableOSDP* Decides whether to use a slave device.

4. *connected* Displays whether a slave device is connected to the master device.

5. *channellnfo* Channel value of slave device.

6. *reserved* Reserved space.

### **BS2OsdpStandardDevice**

<pre>typedef struct {     BS2_DEVICE_ID     BS2_DEVICE_TYPE     BS2_BOOL     BS2_BOOL</pre>	<pre>deviceID; deviceType; enable0SDP; connected;</pre>	///< 4 bytes ///< 2 bytes ///< 1 byte ///< 1 byte
uint8_t	<pre>channelInfo;</pre>	///< 1 byte
uint8_t	osdpID;	///< 1 byte
BS2_BOOL	supremaSearch;	///< 1 byte
BS2_BOOL	activate;	///< 1 byte
BS2_BOOL	useSecure;	///< 1 byte
uint8_t	vendorCode[3]	; ///< 3 bytes

BS2_VERSION	fwVersion;	///< 4 bytes
<pre>uint8_t uint8_t BS2_B00L uint8_t BS20sdpStandardDe</pre>	<pre>modelVersion; readInfo;</pre>	///< 25 byte (packing)

1. *deviceID* OSDP Device Identifier.

2. *deviceType* Device type. Usually gets BS2\_DEVICE\_TYPE\_3RD\_OSDP\_DEVICE.

3. *enableOSDP* Always set to true.

4. *connected* If true, an OSDP device is currently connected.

#### 5. channelInfo

Connected channel information. CoreStation40 has 5 channels from 0 to 4, it has channel values within this range.

6. *osdpID* OSDP Identifier.

7. *supremaSearch* Information that is distinct from existing RS485 that does not support OSDP, and always set to false.

8. *activate* Regardless of the connection status of the device, you can set whether the connected device is operating, which indicates the activation status of the operation.

#### 9. useSecure

Indicates whether encrypted communication is enabled.

If a separate key is not set, encryption communication is used as the default key, and can be changed with BS2\_SetOsdpStandardDeviceSecurityKey.

10. *vendorCode* Unique value of Vendor.

11. *fwVersion* FW version information of OSDP device.

12. *modelNumber* Model number of the OSDP device.

13. *modelVersion* Model version of the OSDP device.

### 14. readInfo

Indicates whether OSDP device information such as vendorCode, fwVersion, or model has. If it has the OSDP device information, it means that the device has ever been connected to the master device.

15. *reserved* Reserved Space.

### BS2OsdpStandardDeviceAvailable

<pre>typedef struct {     uint8_t     BS2_OSDP_CHANNEL_TYPE     uint8_t     uint8_t     BS2_DEVICE_ID</pre>	<pre>channelIndex; channelType; maxOsdpDevice; numOsdpAvailibleDevice deviceIDs[8];</pre>	///< 1 byte ///< 1 byte ///< 1 byte ; ///< 1 byte ///< 4 x 8 = 32
bytes		
<pre>} BS20sdpStandardChannelInf</pre>	0;	///< 36 bytes
<pre>typedef struct {     uint8_t     uint8_t </pre>	<pre>reserved[3];</pre>	///< 1 byte ///< 3 bytes
·	nfo channels[BS2_RS485_MAX	<pre>C_CHANNELS_EX]; ///&lt; 36</pre>
<pre>x 8 = 288 bytes uint8_t } BS20sdpStandardDeviceAvai</pre>	<pre>reserved1[32]; lable;</pre>	///< 32 bytes ///< 288 bytes + 36

### 1. channelIndex

The communication channel number to which the OSDP device is connected.

### 2. channelType

Indicates the type to which the device communicating RS485 is connected.

Based on CoreStation40, there are 5 assignable channels from 0 to 4, and Suprema devices and OSDP devices cannot be mixed and operated within each channel.

If no device is connected to a particular channel, it has a 0 indicating that it can be connected even if it is a Suprema device or an OSDP device.

If a Suprema device is connected to a specific channel, only Suprema devices are allowed to connect to that channel, and channelType has a value of 1. The OSDP device is ignored even if it is connected. If an OSDP device is connected to a specific channel, only OSDP devices are allowed to connect to that channel, and channelType has a value of 2. The Suprema device is ignored even if it is connected.

Each channel of CoreStation40 can be mixed and operated as Suprema device channel and OSDP device channel.

The maximum number of OSDP devices allowed to connect to a channel is limited to 2, and if the channel is already maxed out, the channelType will be 3, indicating that no more connections are allowed.

Value	Description	
0	Normal	

Value	Description
1	Suprema Device
2	OSDP Device
3	OSDP Device FULL

#### 3. maxOsdpDevice

Indicates the maximum number of devices that can be connected in that channel. If the channelType is 1, it will get 32, if 2 or 3, it will get 2.

4. numOsdpAvailibleDevice

Indicates the number of devices currently available for connection in that channel.

5. *deviceIDs* The list of Device Identifier that is connected or can be connected in that channel.

6. *numOfChannel* Number of channel. CoreStation40 has a total of 5 channels.

7. *reserved* Reserved Space.

#### 8. channels

OSDP device information of each channel.

You can have up to 8 channel information, but since CoreStation40 has 5 channels, only numbers 0 to 4 are valid.

9. *reserved1* Reserved Space.

### BS2OsdpStandardNotify

<pre>typedef struct {     BS2_DEVICE_ID     BS2_DEVICE_TYPE     BS2_B00L     BS2_B00L</pre>	<pre>deviceType;</pre>	///< 4 bytes ///< 2 bytes ///< 1 byte ///< 1 byte
uint8_t uint8_t BS2_BOOL BS2_BOOL	<pre>channelInfo; osdpID; supremaSearch; activate;</pre>	///< 1 byte
BS2_BOOL uint8_t	<pre>useSecure; vendorCode[3];</pre>	///< 1 byte ///< 3 bytes
BS2_VERSION	fwVersion;	///< 4 bytes
uint8_t	<pre>modelNumber;</pre>	///< 1 byte

uint8_t	<pre>modelVersion;</pre>	///< 1 byte	
BS2_B00L	readInfo;	///< 1 byte	
uint8_t	<pre>reserved[5];</pre>	///< 5 bytes	(packing)
<pre>} BS20sdpStandardN</pre>	lotify; ///	< 48 bytes	

1. *deviceID* OSDP Device Identifier.

2. *deviceType* Device type. Usually gets BS2\_DEVICE\_TYPE\_3RD\_OSDP\_DEVICE.

3. *enableOSDP* Always set to true.

4. *connected* If true, an OSDP device is currently connected.

5. channelInfo

Connected channel information. CoreStation40 has 5 channels from 0 to 4, it has channel values within this range.

6. *osdpID* OSDP Identifier.

7. *supremaSearch* Information that is distinct from existing RS485 that does not support OSDP, and always set to false.

8. activate

Regardless of the connection status of the device, you can set whether the connected device is operating, which indicates the activation status of the operation.

9. useSecure

Indicates whether encrypted communication is enabled. If a separate key is not set, encryption communication is used as the default key, and can be changed with BS2\_SetOsdpStandardDeviceSecurityKey.

10. *vendorCode* Unique value of Vendor.

11. *fwVersion*FW version information of OSDP device.

12. *modelNumber* Model number of the OSDP device.

13. *modelVersion* Model version of the OSDP device.

14. readInfo

Indicates whether OSDP device information such as vendorCode, fwVersion, or model has. If it has the OSDP device information, it means that the device has ever been connected to the master device.

15. *reserved* Reserved Space.

### BS2OsdpStandardDeviceAdd

```
typedef struct {
    uint8_t
                                                     ///< 1 byte
                    osdpID;
   uint8 t
                                                        ///< 1 byte
                       activate;
   uint8 t
                       useSecureSession;
                                                        ///< 1 byte
   uint8 t
                       deviceType;
                                                        ///< 1 byte
   BS2 DEVICE ID
                     deviceID;
                                                      ///< 4 bytes
BS20sdpStandardDeviceAdd;
                                                      ///< 8 bytes
```

### 1. osdpID

OSDP Identifier. The identifier must be set to a random value between 0 and 126 by the user. This value does not allow duplication within the same channel and may raise an error if duplicated or out-of-range values are set.

If the channels are different within the master device, you can add devices by setting them to the same identifier.

### 2. activate

Specifies the device activation state.

Regardless of the connection state of the device, if set to false, the operation of the device is ignored even if it is successfully connected.

3. useSecureSession

Specifies whether to encrypt communication.

If a separate key is not set, encryption communication is used as the default key, and can be changed with BS2\_SetOsdpStandardDeviceSecurityKey.

4. deviceType

Device type. Should be set to BS2\_DEVICE\_TYPE\_3RD\_OSDP\_DEVICE.

5. deviceID

Device Identifier. When set to 0, the master device automatically allocates.

### BS2OsdpStandardDeviceUpdate

<pre>typedef struct {</pre>	
uint8_t	osdpID;
uint8_t	activate;
uint8_t	useSecureSession;
uint8_t	<pre>deviceType;</pre>
BS2_DEVICE_ID	deviceID;
<pre>} BS20sdpStandardDe</pre>	eviceUpdate;

///< 1 byte ///< 1 byte ///< 1 byte ///< 1 byte ///< 4 bytes ///< 8 bytes

#### 1. osdpID

OSDP Identifier. The identifier must be set to a random value between 0 and 126 by the user. This value does not allow duplication within the same channel and may raise an error if duplicated or out-of-range values are set.

If the channels are different within the master device, you can add devices by setting them to the same identifier.

#### 2. activate

Specifies the device activation state.

Regardless of the connection state of the device, if set to false, the operation of the device is ignored even if it is successfully connected.

#### 3. useSecureSession

Specifies whether to encrypt communication.

If a separate key is not set, encryption communication is used as the default key, and can be changed with BS2\_SetOsdpStandardDeviceSecurityKey.

4. *deviceType* Device type. Should be set to BS2\_DEVICE\_TYPE\_3RD\_OSDP\_DEVICE.

5. *deviceID* Device Identifier.

### BS2OsdpStandardDeviceCapability

<pre>typedef struct {     uint8_t     uint8_t } BS20sdpStandardDeviceC</pre>	<pre>compliance; count; apabilityItem;</pre>	
<pre>typedef struct {     BS20sdpStandardDevic     BS20sdpStandardDevic     BS20sdpStandardDevic     BS20sdpStandardDevic     BS20sdpStandardDevic     BS20sdpStandardDevic</pre>	eCapabilityItem led; eCapabilityItem audio; eCapabilityItem textOu	///< 2 bytes ///< 2 bytes itput; ///< 2 bytes
uint16_t uint16_t	<pre>recvBufferSize; largeMsgSize;</pre>	///< 2 bytes ///< 2 bytes
uint8_t uint8_t uint8_t uint8_t	<pre>osdpVersion; cardFormat; timeKeeping; canCommSecure;</pre>	///< 1 byte ///< 1 byte ///< 1 byte ///< 1 byte

<pre>uint8_t } BS20sdpStandardDevi</pre>	<pre>reserved[4]; .ceCapability;</pre>	///< 4 bytes ///< 28 bytes

#### 1. compliance

Indicates the compliance level according to the function of the PD.

Functions include input, output, led, audio, textOutput, etc. The compliance level is different for each function, so refer to the relevant OSDP document.

2. count

It refers to the number of objects according to the function of the PD, and the meaning of the number is different for each function, so refer to the relevant OSDP document.

3. *input* Define the input (monitoring) function.

4. *output* Define the output (monitoring) function.

5. *led* Define the LED function.

6. *audio* Define the Buzzer function.

7. *textOutput* Define the text output function.

8. *reader* Indicates the number of supported devices, only count information has meaning.

9. *recvBufferSize* Indicates the short message size the PD can receive.

10. *largeMsgSize* Indicates the maximum size of a long message that the PD can process.

11. *osdpVersion* OSDP version.

#### 12. cardFormat

Defines the card data format function and gets a value of 01, 02, or 03. Please refer to the compliance level related to the card data format of the OSDP document.

#### 13. timeKeeping

Indicates the date and time type of the PD and what to keep it for. In OSDP 2.2, this feature is not used.

#### 14. canCommSecure

Indicates whether secure communication is supported.

15. crcSupport Indicates whether checksums are supported.

16. *smartCardSupport* Indicates whether smart cards are supported.

17. *biometricSupport* Indicates whether biometric processing is supported.

18. *securePinEntrySupport* Indicates whether Secure PIN Entry (SPE) is supported.

19. *reserved* Reserved Space.

# ${\tt BS2OsdpStandardDeviceResult}$

```
typedef struct {
    BS2_DEVICE_ID deviceID;
    BS2_OSDP_RESULT result;
} BS20sdpStandardDeviceResult;
```

1. *deviceID* Device Identifier.

2. *result* Gets OSDP device command result value.

Value	Description
0	Success
1	Fail
2	Not available

## ${\tt BS2OsdpStandardDeviceSecurityKey}$

```
typedef struct {
    uint8_t key[BS2_OSDP_STANDARD_KEY_SIZE];
    uint8_t reserved[32];
} BS20sdpStandardDeviceSecurityKey;
```

1. *key* 

16-byte security key used in OSDP device.

2. *reserved* Reserved Space. From: http://kb.supremainc.com/bs2sdk/ - **BioStar 2 Device SDK**
