Possible Integration Option 3 : G-SDK

In addition to the integration method using BioStar2 API or BioStar2 Device SDK, G-SDK has been released as a new integration option.

What is G-SDK?

G-SDK is one of the integration options for communicating with BioStar 2 devices. It is a lightweight, scalable, and cross-platform solution which will expedite your development. Based on gRPC, it supports many programming languages such as Java, C#, Python, Node.js, Go, etc.

How G-SDK works?

[Figure 1. G-SDK architecture]

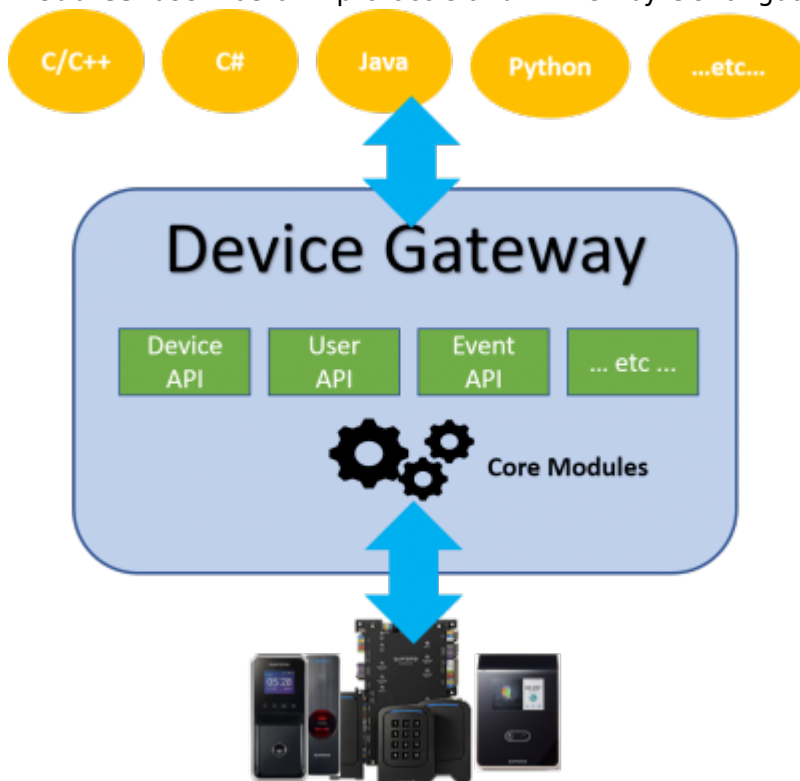

G-SDK consists of Device Gateway in gRPC Server and gRPC Client Libraries.

Based on gRPC, it supports many programming languages such as Java, C#, Python, Node.js, Go, etc. (gRPC (gRPC Remote Procedure Calls) is an open source remote procedure call (RPC) system initially developed at Google in 2015.)

Multi-language support

- Language-neutral IDL
- Native client libraries

Device Gateway that communicates with BioStar 2 device can be run on a server or cloud. **Core modules** use BioStar 2 protocols and written by GO language.

[Figure 2. Device Gateway Structure]

What is different from BioStar 2 Device SDK?

Existing BioStar 2 Device SDK provides C++ library with C#. G-SDK is released to provide flexible development for those who would like to meet the requirements below.

Let's take a look for an easy comparison between BioStar 2 Device SDK and G-SDK.

	BioStar 2 Device SDK	G-SDK
Deployment	<ul style="list-style-type: none"> Shared library 	<ul style="list-style-type: none"> Client libraries Device Gateway
Supported OS	<ul style="list-style-type: none"> Windows X86 Linux 	<ul style="list-style-type: none"> Windows X86/Arm Linux Mac OS
Supported Language	<ul style="list-style-type: none"> C++ C# sample 	<ul style="list-style-type: none"> C++, Java, Python, Go, Ruby, C#, Node.js, Android Java, Objective-C, PHP, Web C#, Java, Python, GO, node samples

[Figure 3. BioStar 2 Device SDK vs G-SDK]

One of the biggest advantages of G-SDK compare to Device SDK is that it supports various languages. For the last years, Device SDK users have had difficulty using development language other than C++ or C# which is in the sample code.

Since BioStar 2 Device SDK can communicate with C++ library, you have to use C++ language or need to marshall all the APIs and structures in the library into other languages. Currently BioStar 2 Device SDK provides only C# marshall sample.

This is a limitation of BioStar 2 Device SDK due to the structure.

[Figure 4. BioStar 2 Device SDK structure]

How G-SDK can support so many languages?

It is because G-SDK is based on gRPC. gRPC is an open RPC framework that supports many languages developed by Google.

Basically, the device gateway is the one that communicates with BioStar 2 device. Your client applications can connect to it using gRPC client libraries.

[Figure 5. G-SDK structure]

What are the next features?

1. Master Gateway

G-SDK can support up to 1000 device connections with a Device gateway.

Currently, Master gateway that will support up to 100,000 device connections is under development. Master Gateway helps you handle multiple Device gateways and it can be deployed on a cloud server or provide mobile direct accessibility too.

	Device Gateway	Master Gateway
Role	<ul style="list-style-type: none"> Manage devices 	<ul style="list-style-type: none"> Manage devices through gateways Manage gateways Provide additional services such as authentication, rate limit, user synchronization, etc.
Deployment	<ul style="list-style-type: none"> Single binary 	<ul style="list-style-type: none"> Single binary Docker
Target Applications	<ul style="list-style-type: none"> Desktop Single site 	<ul style="list-style-type: none"> Mobile Cloud Multi sites
Max. Devices	<ul style="list-style-type: none"> 1,000 	<ul style="list-style-type: none"> 100,000
Design Goals	<ul style="list-style-type: none"> Performance Stability 	<ul style="list-style-type: none"> Scalability Extensibility

[Figure 6. Device Gateway vs Master Gateway]

2. Advanced AC API

G-SDK doesn't support advanced AC such as Zone, Wiegand or RS485 but it supports only simple configurations & features.

In the future, G-SDK will support all the APIs that are supported in the BioStar 2 Device SDK : Zone, Wiegand, RS485, etc.

3. More language support samples

G-SDK provides C#, Java, Python, Go and Node samples. Furthermore, G-SDK is planning to support Android, iOS, Ruby samples.

Summary of G-SDK

Supported OS

Windows, x86/Arm Linux, Mac OS

Maximum number of devices

Up to 1,000

Supported Language

C++, Java, Python, Go, Ruby, C#, Node.js, Android Java, Objective-C, PHP, Web

Supported API

The basic AC APIs(Access control, User management, Event log etc) except advanced features such as Zone, Wiegand, RS485 features.

Supported Device

All BioStar 2 devices

Not Supported Device

All BioStar 1 Devices

(BioEntry Plus v2, BioEntry W v2, XPass v2, XPS2 v2, and BLN v2 are not supported. Gen 1 devices are not supported)
