## BS2\_GetLogSmallBlob

[+ 2.6.4] Retrieves logs filtered by EventMask from the device. The difference from [BS2\\_GetLogBlob](#) which is using [BS2EventBlob](#) is that the parameter imageObj in BS2EventSmallBlob is changed to pointer for memory efficiency. Except this, everything is the same.

### Declaration

```
#include "BS_API.h"

int BS2_GetLogSmallBlob(void* context, uint32_t deviceId, uint16_t eventMask, uint32_t eventId, uint32_t amount, BS2EventSmallBlob** logsObj, uint32_t* numLog);
```

[See BS2EventSmallBlob Structure](#)

### Parameter

- [In] *context* : Context
- [In] *deviceId* : Device ID
- [In] *eventMask* : event mask
- [In] *eventId* : Log record ID, retrieves from the first record if it is 0
- [In] *amount* : log amount, retrieves all after eventId if it is 0
- [Out] *logsObj* : Pointer of storing the log record address
- [Out] *numLog* : The number of log records

#### NOTE

The logsObj variable needs to return the memory to the system by the [BS2\\_ReleaseObject](#) function after being used.

### Return Value

If successfully done, BS\_SDK\_SUCCESS will be returned. If there is an error, the corresponding error code will be returned.
