How to configure the email notification settings

You can send email notifications to users when an alarm goes off. You can specify a user's email address information on BioStar.

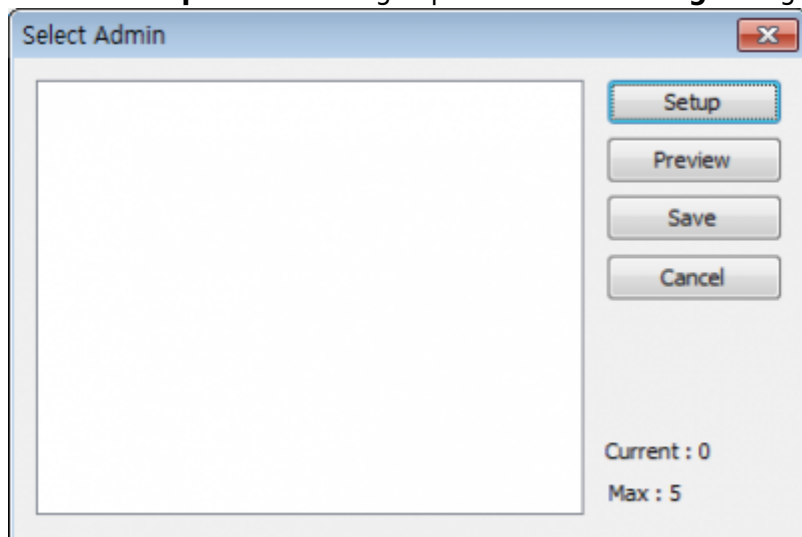

1. On the **Monitoring** page, choose **Alarm Setting** on the **Task** pane.

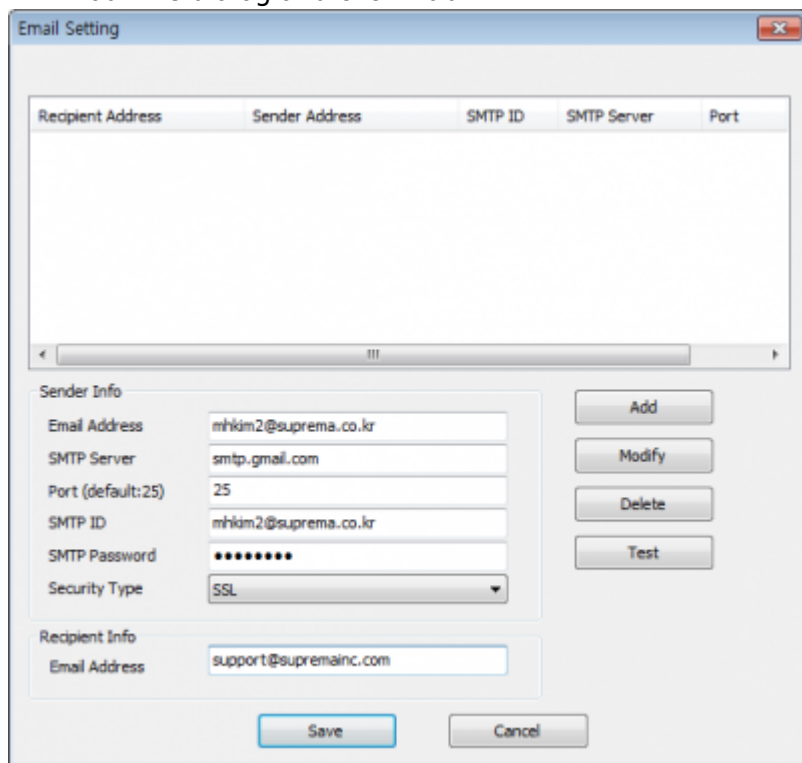

2. The **Alarm Setting** dialog will show up. Click **browse(...)** at the left of the **Send Email** checkbox and this brings up the **Select Admin** dialog.

3. Click **Setup** and this brings up the **Email Setting** dialog.

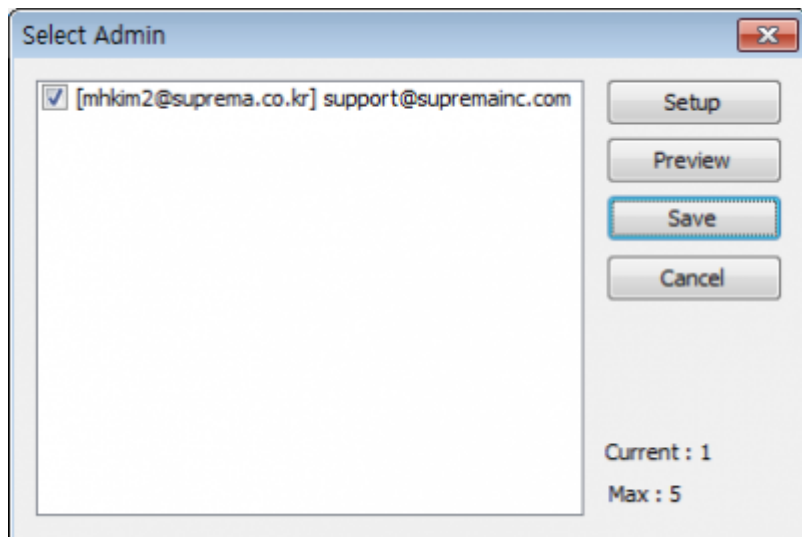

4. Fill out the dialog and click **Add**.

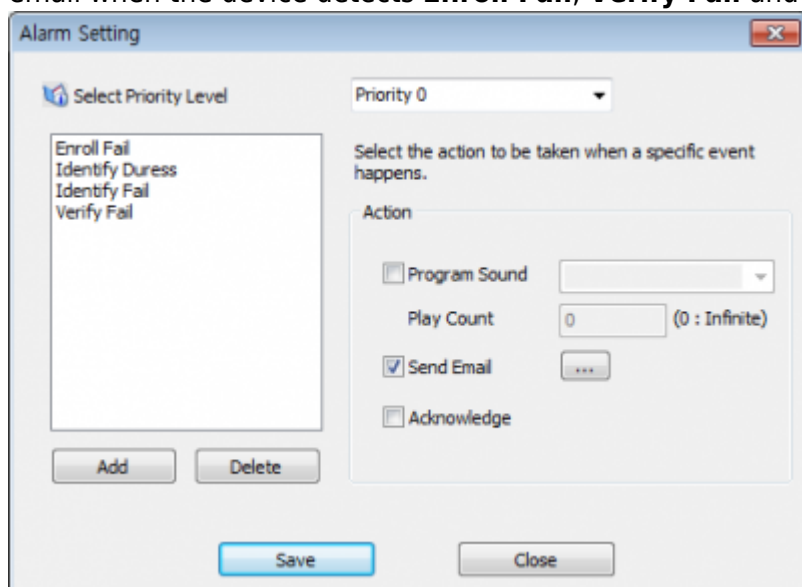

5. Click **Test** to see if the configuration is correct.

6. Click **Save**. Then this brings up the **Email Setting** dialog.

7. Check the checkbox at the left of the email address and click **Save**. Then this will bring up the Alarm Setting dialog.

8. Click **Save** and the email notification setup procedure is completed and the user will receive an email when the device detects **Enroll Fail**, **Verify Fail** and **Identify Duress** events.

9. This is a sample email when the device detects an **Identity Fail** event.
